## Frontend Selection Discussion – Meeting Record

**Xiang Chang:** Everyone, please take a look at each other ' s interfaces and see whether any particular design clearly stands out.

**Wen Sun:** Looking at them together, I feel that mine looks a little like WeChat.

**Other team members:**Laughter.

**Nuo Chen:** That is not necessarily a problem. Since it is a conversational interface, if we used a WeChat-style design, different contacts could simply represent different conversations.

**Xiang Chang:** Based on my initial comparison, I think Nuo Chen ' s and Yingzhe Xu ' s designs are quite good. They both have the polished appearance of a mature AI product. By comparison, some of the other designs feel more like traditional websites.

**Xingyu Li:** I feel the same way.

**Yingzhe Xu:** In that case, let ' s discuss which design we should use.

**Xiang Chang:** I think Nuo Chen ' s design looks too similar to ChatGPT. Could that potentially create an infringement concern later? Since this is a government-supported project, I think the interface should be distinguishable from the major AI products currently available. It may not be appropriate for it to look too similar to one particular product.

**Other team members:** In that case, let ' s use Yingzhe Xu ' s design.

**Nuo Chen:** Does anyone have any suggestions for improving it?

**Wen Sun:** The other designs support multiple conversation windows, but Yingzhe Xu ' s interface does not appear to include that feature.

**Nuo Chen:** Do we actually need multiple conversation windows? Given the current size and capabilities of our model, it may be difficult to support multiple conversations and maintain separate conversation histories in the same way as mature commercial AI products. I think the current design is sufficient for this stage.

**Xiang Chang:** Agreed. In that case, there are no further changes required at this stage.  
Decision

The team agreed to use Yingzhe Xu ' s frontend design as the primary ChatJoey interface

.
